I3. The DUT

The Diplôme Universitaire de Technologie (DUT) is also a two-year national post-secondary diploma qualification. DUT options span 88 specialty fields which, as with the BTS, have been harmonised with the European LMD (Licence, Master, Doctorat) degree ladder.

As distinct from the broad delivery of the BTS, the DUT is earned in 113 university-based institutes of technology known as IUTs. These institutes offer programmes across the following manufacturing and service specialties.

- Chemistry, biology, physics
- Electronics, electricity, computer science, mechanics
- Public works, energy, security
- Administration and business management
- Legal and social services
- Information technology and communications

Campus France adds, “The range of subjects taught, the selectivity of admissions, the close involvement of economic and social partners, and the excellent employment prospects of graduates make the DUT a programme of excellence recognised throughout the world and chosen by more than 115,000 students every year. From an international perspective, various characteristics of DUT programmes set them apart among post-secondary vocational programs: their university affiliation, the wide range of short programmes covering all sectors of economic activity, strong involvement of economic and social partners, and selective admissions.”

DUT graduates who wish to continue towards a degree qualification may opt to enrol in a *Licence professionnelle* program or take a business school

entrance examination. Holders of an industrial-stream DUT also have the option of transferring into a school of engineering.
